Test Results: Genotype of your dog is Normal/Clear.

Risk for developing PRA: This dog will never develop the prcd form of PRA (progressive rod-cone degeneration form of Progressive Retinal Atrophy). Note that PRA in Poodles appears to consist of at least two different genetic defects. Prcd-PRA is by far the most frequently identified cause of PRA in Miniature and Toy Poodles. However, a poodle of known status for prcd-PRA could still be at risk for another, less frequent, and as yet unidentified form of PRA.

Significance for breeding: Genetically Normal/Clear dogs can be bred to any dog and will produce no pups affected with the prcd form of PRA.
